

Aquatec Fish Tank

Aquatec have many years of experience in build-up concrete foundations for fish tanks. Our new PVC mold systems secure fast and easy preparation for building concrete foundations. We also use fish tanks in fiber glass depending on the purpose.

Our PVC Molds are ideal for the construction of aquaculture tanks, slurry tanks, agricultural barns, treatment plants for drinking water, solid waste treatment plants and agricultural buildings.

The walls of the PVC Molds can be erected simply and quickly. The walls are composed of two main components: a structural component and a flat wall covering, which are assembled by sliding one into the other vertically, from above. A built-in flexible sealing strip is part of the profile in order to make the walls waterproof. This strip is made of flexible antifungal thermoplastic. (patent pending)
